

Intelligent Capture for Bills of Lading

A smarter way to handle bills of lading

A bill of lading (BOL) is one of the most important documents in the transportation industry. It serves three primary purposes: acts as a receipt for shipment, evidences the contract of carriage and serves as a document of title. A BOL contains all the details needed to process the movement of goods and invoice those goods correctly.

With Perceptive Intelligent Capture for Bills of Lading from Lexmark, processing BOLs has never been easier—or more accurate. Our solution eliminates manual data entry by automatically extracting, classifying and validating BOL data against your core systems. The results?

- ▶ Process more BOLs with fewer errors and at a lower cost
- ▶ Generate invoices faster and shorten the time to revenue collection
- ▶ Improve on-time shipments with higher throughput and fewer mistakes
- ▶ Engage your employees in more value-add tasks beyond manual data entry

How does it work?

It couldn't be simpler! Our solution recognizes and extracts line-item data from bills of lading, verifies the accuracy of that information against your core systems and then exports that information to your core systems—all of which happens automatically without manual effort. Integrated exception handling, as well as storage and retrieval of electronic information, enables your team to practically eliminate rekeying data and the errors that manual processes introduce.
